Hospice Basics

Hospice service is offered to patients and their families when cure is no longer possible or no longer sought and prognosis is estimated to be less than 6 months.

Hospice care can be a tremendous source of emotional and physical support for patients and their families. Quality of life becomes the focus with symptom control, pain management and support for navigating social, emotional and spiritual transitions.

Hospice neither hastens nor prolongs the natural disease process. In fact, participation in hospice has been shown to lengthen life expectancy in some patients. Pain and symptom management, hospitalization rates, and patient/family satisfaction improves when patients receive hospice interdisciplinary care.

The criteria within this booklet are to be used as guidelines and should not take the place of your clinical judgment. Informational visits are available and provided in your patient’s home. Contact our Referral center or hospice physicians if you have any questions about patient eligibility: 360-814-5550
Would you be surprised if your patient died within the next year? Ten questions to help you determine if your patient is eligible for hospice:

Has your patient:

1. Been hospitalized or to the Emergency Room several times in the last six months?
2. Started needing help from others with any of the following?
   A. Getting out of bed
   B. Dressing
   C. Eating
   D. Walking
   E. Showering
   F. Toileting
3. Started feeling weaker or more tired/sleeping more?
4. Started spending most the day in bed or a chair?
5. Fallen several times in the last 6 months?
6. Noticed shortness of breath with minimal activity or at rest?
7. Been making more frequent visits to the provider’s office, or now arriving by wheelchair or with family help?
8. Started medication to lessen pain/shortness of breath?
9. Experienced any weight loss or worsening appetite?
10. Been told by you or another provider that life is limited?
Dementia

1. Patient must have ALL of these signs and symptoms:
   - Unable to walk without direct assistance
   - Unable to dress themselves
   - Need help for bathing and grooming
   - Unable to control bowel and bladder
   - Might use some language, but unable to converse effectively

2. They must also have experienced at least ONE of the following in the last year:
   - Serious lung or kidney infection (pneumonia; pyelonephritis)
   - Sepsis
   - Severe open pressure ulcers (stage 3-4 decubiti)
   - Persistent fever, even after antibiotics
   - Profound nutritional impairment (weight loss of >10% in last 6 months or serum albumin <2.5gm/dl)
   - Recent hospitalization
   - Mitchell Mortality Risk Indicator score >9
     (See Appendix 4)

In the absence of one or more of the above findings, rapid decline or co-morbidities may also support eligibility for hospice care.
Amyotrophic Lateral Sclerosis (ALS)

The patient meets at least one of the following (1 or 2)

1. Severely impaired breathing capacity with all of the following findings:
   - Dyspnea at rest
   - Vital capacity less than 30%
   - Requirement for supplemental oxygen at rest
   - The patient declines artificial ventilation (NIPPV is accepted)

2. Rapid disease progression is evident, plus, either a or b below:
   Rapid disease progression as evidenced by all of the following in the preceding twelve (12) months:
   - Progression from independent ambulation to wheelchair or bed-bound status
   - Progression from normal to barely intelligible or unintelligible speech
   - Progression from normal to pureed diet
   - Progression from independence in most or all Activities of Daily Living (ADLs) to needing major assistance by caregiver in all ADLs

   a. Severe nutritional impairment demonstrated by all of the following in the preceding twelve (12) months:
ALS

- Oral intake of nutrients and fluids insufficient to sustain life
- Continuing weight loss
- Dehydration or hypovolemia
- Absence of artificial feeding methods

OR

b. Life-threatening complications demonstrated by one or more of the following in the preceding twelve (12) months:
   - Recurrent aspiration pneumonia (with or without tube feeding)
   - Upper urinary tract infection (Pyelonephritis)
   - Sepsis
   - Recurrent fever after antibiotic therapy
   - Stage 3 or Stage 4 decubitus ulcer(s)

In the absence of one or more of the above findings, rapid decline or co-morbidities may also support eligibility for hospice care.
Cancer

The patient has 1, 2 and 3

1. Clinical findings of malignancy with widespread, aggressive, or progressive disease as evidenced by increasing symptoms, worsening lab values and/or evidence of metastatic disease.

2. Impaired performance status with a Palliative Performance Score (PPS) <70%. (See Appendix 2)

3. Patient is uninterested in further curative therapy or continues to decline despite definitive therapy. Decline is evidenced by:
   - Hypercalcemia ≥12
   - Cachexia or weight loss of 5% in the preceding three months
   - Recurrent disease after surgery/radiation/chemotherapy
   - No present goals to pursue curative or prolonging cancer treatment
   - Signs and symptoms of advanced disease (e.g. nausea, anemia, malignant ascites, pleural effusion, etc.)

The following information is supporting:

1. Tissue diagnosis of malignancy
   OR
2. Reason(s) why a tissue diagnosis is not available
In the absence of one or more of the above findings, rapid decline or co-morbidities may also support eligibility for hospice care.
Cerebral Vascular Accident/Stroke or Coma

The patient has both 1 and 2

1. Poor functional status with Palliative Performance Scale of 40% or less (unable to care for self) (See Appendix 2)

2. Poor nutritional status with inability to maintain sufficient fluid and caloric intake with one of the following:
   - >10% weight loss over the previous six (6) months - or -
   - >7.5% weight loss over the previous three (3) months
   - Serum albumin <2.5 gm/dl
   - Current history of pulmonary aspiration without effective response to speech language pathology interventions to improve dysphagia and decrease aspiration events

Supporting evidence for hospice eligibility:
Coma (any etiology) with three (3) of the following on the third (3rd) day of coma:
   - Abnormal brain stem response
   - Absent verbal responses
   - Absent withdrawal response to pain
   - Serum creatinine >1.5 gm/dl

In the absence of one or more of these findings, rapid decline or co-morbidities may also support eligibility for hospice care.
Heart Disease/CHF

Basic Requirements:

1. **New York Heart Association Class IV CHF:** Symptoms at rest such as dyspnea, orthopnea, PND, edema, syncope, profound weakness, or chest pain. (See Appendix 1)

   OR

   **Severe Aortic Stenosis:** with orthostatic hypotension, falls and functional loss

   OR

   **Class III CHF:** (comfortable only at rest/marked limitation of any activity)

   **AND** any 2 of the following:

   - Hospitalization for CHF in the last year
   - Stage 3 CKD with GFR <45
   - Systolic BP <100 or resting HR >100
   - Anemia with Hgb <12
   - Hyponatremia with sodium <132
   - Limited functional ability (PPS 40% or less) (See Appendix 2)
   - Pleural effusion or ascites requiring diuretics
   - History of cardiac arrest or resuscitation
   - Cardiac cachexia (weight loss 5% in the last 6 months)
   - Treatment-resistant dysrhythmias

   **AND**
2. Maximally medically managed or unable to tolerate further medication management

AND

3. No plans for surgical or other cardiac interventions

Supporting evidence for hospice eligibility:
- Echo demonstrating an ejection fraction of 20% or less
- History of unexplained or cardiac related syncope
- CVA secondary to cardiac embolism

In the absence of one or more of these findings, rapid decline or comorbidities may also support eligibility for hospice care.
Liver Disease

The patient has both 1 and 2

1. Liver failure as demonstrated by a or b:
   a. International Normalized Ratio (INR) > 1.5 (not on warfarin)
   b. Serum albumin <2.5gm/dl

AND

2. End-Stage liver disease is present, and the patient has one or more of the following conditions:
   • Ascites, refractory to treatment or patient declines or is non-compliant
   • History of spontaneous bacterial peritonitis
   • Hepatorenal syndrome (elevated creatinine with oliguria [<400 ml/day])
   • Hepatic encephalopathy, refractory to treatment or patient non-compliant
   • History of esophageal varices

Supporting evidence for hospice eligibility:
   • Progressive malnutrition
   • Muscle wasting with reduced strength
   • Ongoing alcoholism (>80 gm ethanol/day)
   • Hepatocellular carcinoma
   • Hepatitis B surface antigen positive
   • Hepatitis C, refractory to treatment

In the absence of one or more of these findings, rapid decline or comorbidities may also support eligibility for hospice care.
Pulmonary Disease

REQUIRED:
Dyspnea with minimal exertion
Decreased functional capacity - evidence of one of the following:
- Spends most of day in chair or bed, often arrives in wheelchair to office visits
- Fatigue with minimal exertion – need to rest during or after showering/bathing
- Exhausted from cough
- Evidence of pursed lip breathing with conversation
- Tripod positioning, evidence of pressure sores on elbows
- Increasing somnolence
- Difficulty completing a meal due to dyspnea

NOT REQUIRED but supporting:
- FEV1 <30% if COPD; DLCO < 40 if Pulmonary Fibrosis
- Poor response to bronchodilators or use is frequent (>QID use)
- Steroid and oxygen dependent:
- Requires frequent oral steroid doses (monthly)
- Develops exacerbation with attempts to wean steroids
- Hypoxia at rest (PO2 <55mmHG/sat 88%) or Hypercapnia pCO2 >50mm HG in last 3 months
Have co-morbid disease that makes dyspnea worse and episodic (CHF, ESRD, anemia, CAD, morbid obesity, OSA, restrictive disease)

- Progressive dementia:
  - Changing goals of care by family
  - Now unable to use MDIs

- Frequent clinic, ED or hospital visits for respiratory infections; respiratory failure in the last 12 months

- Evidence of Cor pulmonale

- Unintentional weight loss of >5% in past 6 months

- Resting tachycardia

- Increasing anxiety/fearfulness/air hunger and hopes to avoid more hospital care

- Still smoking
Multiple Sclerosis

The patient must meet at least one of the following criteria (1 or 2):

1. Severely impaired breathing capacity with all of the following findings:
   • Dysspnea at rest
   • Vital capacity less than 30%
   • The requirement of supplemental oxygen at rest
   • The patient declines artificial ventilation

OR

2. Rapid disease progression and either a or b below:
   Rapid disease progression as evidenced by all of the following in the preceding twelve (12) months:
   • Progression from independent ambulation to wheelchair or bed-bound status
   • Progression from normal to barely intelligible or unintelligible speech
   • Progression from normal to pureed diet
   • Progression from independence in most or all Activities of Daily Living (ADL) to needing major assistance by caretaker in all ADLs

AND

a. Severe nutritional impairment demonstrated by all of the following in the preceding twelve (12) months:
MULTIPLE SCLEROSIS

- Oral intake of nutrients and fluids insufficient to sustain life
- Continuing weight loss
- Dehydration or hypovolemia
- Absence of artificial feeding

OR

b. Life-threatening complication demonstrated by one or more of the following in the preceding twelve (12) months:

- Recurrent aspiration pneumonia (with or without tube feedings)
- Upper urinary tract infections (e.g. Pyelonephritis)
- Sepsis
- Recurrent fever after antibiotic therapy
- Stage 3 or 4 decubitus ulcer(s)

In the absence of one or more of these findings, rapid decline or comorbidities may also support eligibility for hospice care.
Parkinson’s Disease

The patient must meet at least one of the following criteria (1 or 2):

1. Severely impaired breathing capacity with all of the following findings:
   - Dyspnea at rest
   - Vital capacity less than 30%
   - The requirement of supplemental oxygen at rest
   - The patient declines artificial ventilation

   OR

2. Rapid disease progression and either a or b below:
   - Progression from independent ambulation to wheelchair or bed-bound status
   - Progression from normal to barely intelligible or unintelligible speech
   - Progression from normal to pureed diet
   - Progression from independence in most or all Activities of Daily Living (ADL) to needing major assistance by caretaker in all ADL
   - Progression of Dementia (often Lewy-Body type), now FAST score 7A (See Appendix 3)

AND

a. Severe nutritional impairment demonstrated by all of the following in the preceding twelve (12) months:
PARKINSON’S DISEASE

• Oral intake of nutrients and fluids insufficient to sustain life
• Continuing weight loss
• Dehydration or hypovolemia
• Absence of artificial feeding

OR

b. Life-threatening complications demonstrated by one or more of the following in the preceding twelve (12) months:

• Recurrent aspiration pneumonia (with or without tube feedings)
• Upper urinary tract infection (e.g. Pyelonephritis)
• Sepsis
• Recurrent fever after antibiotic therapy
• Stage 3 or 4 decubitus ulcer(s)

In the absence of one or more of these findings, rapid decline or comorbidities may also support eligibility for hospice care.
Renal Failure

The patient has 1 and either 2 or 3.

1. The patient is not seeking dialysis or transplant

AND

2. Creatinine clearance* $<10\text{cc/min} (<15\text{cc/min for diabetics})$

*Creatinine Clearance Calculation for men

$$CrCl = \frac{(140\text{-age, in years}) \times \text{(weight, in Kg)}}{72 \times \text{(serum creatine in mg/dl)}}$$

*Creatinine Clearance Calculation for women

$$CrCl = \frac{(140\text{-age, in years}) \times \text{(weight, in Kg)} \times 0.85}{72 \times \text{(serum creatine in mg/dl)}}$$

OR

3. Serum creatinine $>8.0\text{mg/dl} (>6.0\text{mg/dl for diabetics})$

Supporting evidence for hospice eligibility:

- Uremia
- Oliguria (urine output is less than 400cc in 24 hours
- Intractable hyperkalemia (greater than 7.0), not responsive to treatment
RENAL FAILURE

- Uremic pericarditis
- Hepatorenal syndrome
- Immunosuppression/AIDS
- Intractable fluid overload, not responsive to treatment

In the absence of one or more of these findings, rapid decline or comorbidities may also support eligibility for hospice care.
NEW YORK HEART ASSOCIATION (NYHA)  
FUNCTIONAL CLASSIFICATION (Class & Description)

I  Patients with cardiac disease, but without resulting limitation of physical activity.  
Ordinary physical activity does not cause undue fatigue, dyspnea, palpitations or angina pain.

II Patients with cardiac disease resulting in slight limitation of physical activity.  They are comfortable at rest.  
Ordinary physical activity results in fatigue, dyspnea, palpitations or anginal pain.

III Patients with marked limitations of physical activity.  
They are comfortable at rest.  
Less than ordinary physical activity causes fatigue, palpitations, dyspnea or anginal pain.

IV Patients with cardiac disease resulting in inability to carry on any physical activity without discomfort.  Symptoms of heart failure or of the anginal syndrome may be present even at rest.  
If any physical activity is undertaken, discomfort is increased.
Patients with a Palliative Performance Scale of 40% and chronic or serious illness are generally hospice eligible.

Patients with a Mitchell Mortality Score of >9 are generally hospice eligible.
Basic ADLs

Basic ADLs consist of self-care tasks, including:

- Personal hygiene and grooming
- Dressing and undressing
- Feeding oneself
- Functional transfers, e.g., getting out of bed
- Voluntarily controlling urinary and stool elimination
- Ambulation (walking or using a wheelchair)

Instrumental ADLs

Instrumental activities of daily living (IADLs) are not necessary for fundamental functioning, but they let an individual live independently in a community:

- Housework
- Meal preparation and clean-up
- Tracking medications
- Managing money
- Shopping for groceries or clothing
- Telephone use
- Using technology (as applicable)
- Care of others (including selecting and supervising caregivers)
- Care of pets
- Child rearing
- Use of communication devices
- Community mobility
- Financial management
- Health management and maintenance
- Safety procedures and emergency responses
Hospice comfort medications:

**Morphine sulfate 20mg/ml liquid;** 5 mg (0.25cc) po/sl every 1 hour as needed for pain or shortness of breath.
(Start with 2.5 mg (0.125cc) dose in opiate naïve patients)

**Lorazepam 2mg/ml liquid;** 0.5 mg (0.25cc) po/sl every 2 hours as needed for anxiety.

**Haloperidol 2mg/ml liquid;** 0.5mg (0.25cc) po/sl every 2 hours as needed for nausea or agitation.
(Yes! It works well for nausea at end of life)

**Atropine ophthalmic drops;** 2 drops sublingually q 2 hours as needed for hyper secretions.

**Opioid Equivalency Pearls:**

**Hydrocodone** is equivalent to oral morphine in opiate strength
ie. Hydrocodone 5mg = oral morphine sulfate 5 mg

**Oxycodone** is 50% stronger than oral morphine
ie. Oxycodone 5mg = oral morphine sulfate 7.5mg

**Oral hydromorphone** is five time stronger than oral morphine
ie. oral hydromorphone 2 mg = oral morphine sulfate 10 mg

**IV morphine** is 2-3 times stronger than oral morphine
ie. IV Morphine 2 mg = oral morphine 5 mg

**IV Hydromorphone** is 20 times stronger than oral morphine
ie. IV hydromorphone 1mg = oral morphine 20 mg
